abojude PROMOTED

Hello,

I already have a Flutter + Firebase application called Wasel Canada.

The app is partially completed and currently supports Arabic and English language switching.

I need an experienced Flutter developer to:

- Review the existing source code
- Fix current errors
- Complete remaining screens and functionality
- Connect Firebase services correctly
- Prepare Android and iOS builds for publishing

Before hiring, I would like a code review and an estimate for cost and timeline.

Please tell me:

1. How much it will cost?
2. How many days are needed?
3. Have you worked on delivery or service apps before?

Thank you.

This message relates to:

Me

Hello Abojude

Thank you for the detailed explanation of your "Wasel Canada" app.

Before giving a fixed cost or timeline, I would first start with a proper code review of the current Flutter + Firebase setup. From experience, partially completed apps often vary a lot in structure, so the actual effort depends heavily on how clean and scalable the existing codebase is.

Once I review it, I can give you a precise estimate for cost and delivery time.

In general terms:

- > If the codebase is well-structured, completing features + fixing issues is usually straightforward and faster.
- > If there are architectural issues or outdated patterns, sometimes it becomes more efficient to refactor key parts while completing the remaining features to ensure smooth Android/iOS publishing and future scalability.

Yes, I have worked on multiple delivery/service-type apps with Flutter + Firebase, including real-time flows, multi-language support, and production deployment to both the Play Store and the App Store.

If you share the source code, I can quickly review it and get back to you with a clear plan, exact timeline, and cost breakdown.

Looking forward to hearing from you

Regards

abojude

I'll prepare all info and get back to you as soon thnx

Me

Glad to hear that

I'm waiting, just send the details, we can start from there

abojude

abojude

Hi,

I have attached the Flutter project source code.

Please review the project and let me know:

1. Current status of the app.
2. What still needs to be completed.
3. Estimated cost.
4. Estimated timeline.
5. Whether Firebase is configured correctly.

Thank you.

Me

Thanks for sending over the Wasel Canada source code!

I've completed a thorough review of your Flutter + Firebase setup, and I wanted to give you my honest assessment before we move forward.

Your Firebase configuration is actually really solid. Everything is properly set up across iOS, Android, and Web platforms, the API keys, bundle IDs, and google-services.json files are all correct. That's genuinely the hardest part of the setup, and you've already nailed it! Your multi-language support (Arabic/English) also shows you're thinking about your target market, which is smart.

What's missing:

- > A proper state management system (this will become a real pain point as you add features)
- > The main navigation shell isn't actually being used (structural issue)
- > Authentication system (no login/signup)
- > Database integration (Firestore/Realtime Database)
- > The pages are mostly placeholder screens with no real functionality
- > No production app signing setup yet

Actually, I would like to know what's your timeline looking like, and roughly how much are you willing to invest to get this to launch? That'll help me give you a more precise estimate on whether this is a 1-month project or a 2-month project.

Also, are you planning to handle p-ayments through the app, or is this more of a service booking platform where p-ayments happen offline?

Let me know your thoughts, and we can talk through the best path forward!

Just dropping a quick note to say hello and let you know that I'm eagerly awaiting your response.

Jun 07, 5:19 AM

Abojude

Thank you.

My goal is to launch a production-ready version of Wasel Canada on Android and iOS.

Core features:

- User registration and login

- Buy & Sell listings

- Jobs listings

- Business and service advertisements

- Featured listings

- Arabic and English support

- Location-based browsing within Canada

- Direct contact via phone, messages, and WhatsApp

- Firebase backend

- Admin panel

- App Store and Google Play publishing

Please provide:

1. Fixed total price

2. Delivery timeline

3. Detailed milestone breakdown

4. Any additional recommendations

Thank you.

Jun 08, 6:51 AM

Me

Hello Abojude, thanks for the time

I've completed a full review of the source code, and here is my detailed assessment and structured proposal.

--> Current Code Status

Your Firebase setup is genuinely solid. "The firebase_options.dart" is properly CLI-generated with correct App IDs registered for Android, iOS, Web, and macOS under the project wasel-canada. That's the part most developers get wrong, and you've already cleared it correctly.

And, beyond Firebase initialization, what currently exists is a 3-screen skeleton, HomePage, SecondPage, ThirdPage, with placeholder text only, a working AR/EN language toggle (via setState), and a MainShell with bottom navigation that is built but not wired into main.dart - meaning it's not even reachable yet. No authentication, no Firestore, no real screens, no state management.

Honest assessment: the app is approximately 5-8% complete. The foundation is clean, and the Firebase groundwork is real, but everything functional still needs to be built.

So now, here is the list:

- User registration and login

- Buy & Sell listings

- Jobs listings

- Business and service advertisements

- Featured listings

- Arabic and English support

- Location-based browsing within Canada

- Direct contact via phone, messages, and WhatsApp

- Firebase backend

- Admin panel

Jun 08, 7:27 AM

Me

--> 4-Phase Milestone Plan

Phase 1: UI/UX & Frontend (30 days, \$2000)

Full Flutter UI built screen by screen, fully bilingual (AR/EN) with proper RTL support, no backend calls yet, but all screens navigation-ready.

- Splash screen, onboarding, app structure & navigation shell

- Auth screens (Login, Register, Forgot Password)

- Home feed with category filters

- Buy & Sell listing screens (list view + detail view + post form)

- Jobs listing screens (list + detail + post form)

- Business & Services screens

- Featured listings UI (banner/highlighted cards)

- Location selector (Canada provinces/cities)

- User profile & my listings screens

- Admin panel UI (Flutter Web)

Phase 2: Backend (30 days, \$1500)

Custom backend system built from scratch:

- REST API design and architecture

- Database schema design (PostgreSQL or MongoDB)

- User authentication & authorization (JWT)

- Listings CRUD endpoints (Buy & Sell, Jobs, Business, Services)

- Featured listings logic & management

- Image upload & storage handling

- Location filtering by Canadian provinces & cities

- Role-based access control (user/admin)

- Admin panel backend (approve/reject listings, ban users, manage featured)

- API documentation

Phase 3: APIs & Integrations (15 days \$700)

All third-party connections and contact features:

- WhatsApp deep link integration

- Phone call intent

- In-app messaging between users (Firestore-based chat)

- Firebase Cloud Messaging (push notifications, new message, listing approved, etc.)

- Google Maps / Places API for location tagging on listings

- Deep linking for sharing listing URLs

Phase 4: DevOps & Publishing (7-10 days- \$300)

Production-ready, live on both stores:

- Android release signing (keystore, build, gradle config)

- iOS provisioning profiles & certificates (Xcode setup)

- App icons & splash screens for both platforms

- Google Play Store submission (all metadata, screenshots, descriptions)

- Apple App Store submission (review-ready build, privacy policy)

- Post-launch monitoring & first-week bug fixes included

--> Total Fixed Price: \$4,500 USD

--> Total Timeline: 90 days approximately

Payment structure: You will just pay for the phase that will work ongoing, it's will start with phase 1, after 1st phase finishes, then the next phase will start (And yes, every phase will start and end by your approval)

Jun 08, 7:34 AM

Abojude

Since the project already uses Firebase and the Firebase configuration is already complete, why do we need a custom backend instead of Firebase Authentication, Firestore, Storage, and Cloud Functions?

Could you please provide a revised estimate based on keeping Firebase as the primary backend?

Jun 08, 8:22 AM

Me

That's a completely valid question, and I appreciate you pushing back on it; it shows you're thinking carefully about the architecture.

Here's my honest reasoning:

1. Firebase works well for simple apps. But Wasel Canada isn't a simple app. You're describing a multi-category classifieds platform, Buy & Sell, Jobs, Business listings, Featured placements, location filtering across Canada, admin moderation, and direct user contact. That's closer in complexity to Kijiji or OLX15 than a typical startup MVP.

Jun 08, 8:41 AM

The specific reasons I recommended a custom backend:

1. Featured listings = business logic Firebase can't handle cleanly
Featured placements usually involve pay-ment, expiry dates, priority ranking, and admin control.
Doing this in Firestore with Cloud Functions gets messy fast, and it becomes very hard to manage or audit as the listing volume grows.
2. Search and filtering at scale:
Firestore's querying is limited. You can't do compound filters cleanly across category + location + price + date without workarounds. A proper backend with PostgreSQL gives you full-text search, indexed filters, and sorting that actually scales as your listings grow into the thousands.

3. Admin panel needs real control:
Approving/rejecting listings, banning users, managing featured slots, pulling reports, Firebase can do some of this, but a dedicated backend gives your admin panel proper role logic, audit logs, and flexibility without hacking around Firestore's security rules.

4. You're building for Canada, not just one city:
Location-based browsing across provinces and cities with proper filtering needs a query engine, not Firestore's limited geo-queries.

5. Long-term cost:
Firestore pricing scales with reads/writes. A classifieds app with heavy browsing traffic (users scrolling through hundreds of listings) can get expensive on Firebase fast. A self-hosted backend is predictable in cost.

So, as I've said, Firebase Auth and Firebase Storage I'd still keep. Authentication and file storage are genuinely where Firebase shines, and there's no reason to replace them.

So the revised architecture would be:
--> Firebase Auth: user login/registration
--> Firebase Storage: image uploads
--> Custom REST API: all listing logic, search, featured, admin, location filtering
--> Firebase Cloud Messaging: push notifications

This is actually the architecture used by most serious classifieds and marketplace apps. Firebase for what it does best: a real backend for everything else.

Abojude

Jun 08, 8:53 AM

Thank you for the detailed explanation. Your reasoning makes sense.

Before moving forward, I need to clarify two points:

1. Will the \$4,500 USD fixed price include everything needed to launch the first production version on both Android and iOS, including:
- * User login/registration
 - * Buy & Sell listings
 - * Jobs listings
 - * Business/Services listings
 - * Featured listings
 - * Admin panel
 - * Search and filters
 - * Location filtering across Canada
 - * Firebase Auth
 - * Firebase Storage
 - * Push notifications
 - * App Store and Google Play preparation

2. Can we reduce the first version to an MVP and keep the backend architecture scalable, but without overbuilding features that are not needed for launch?

Please provide a simplified MVP scope with your best price and timeline

Me

Jun 08, 9:07 AM

Yes to both questions.

\$4,500 already covers everything you listed. That's the full production launch price; nothing is hidden in a second invoice.

And your MVP thinking is exactly right. So here's what I'd suggest: we shouldn't cut the price because if we do, it will cut project scope, so a smart move is to cut what goes into v1 and defer the rest to v2 once you're live and generating traction. The backend gets built to handle everything from day one, so in future nothing needs rebuilding later.

So the \$4500 USD price is for that system.

- >Now What ships in v1: (entire system building)
- Firebase Auth (e-mail + phone login)
 - Buy & Sell, Jobs, Business & Services listings (post, browse, filter, detail)
 - Featured listings (admin-controlled, no payment gateway yet)
 - Location filtering by Canadian province and city
 - WhatsApp, phone, and in-app contact
 - Push notifications
 - Admin panel (approve/reject listings, manage users, manage featured)
 - Arabic/English with full RTL support
 - App Store + Google Play submission

- >Deferred to v2 (after launch, when you are ready):
- In-app payment for featured listings
 - Full-text search
 - Advanced analytics
 - Deep linking / social sharing

Why, the \$4,500 stays the same because the backend still needs to be architected to support v2 from the start. Cutting corners there is what causes expensive rebuilds later, and I'd rather be honest about that now than fix it after launch.

Phase-by-phase, you only pay as each phase is delivered and approved. So the financial risk on your side is minimal.

Ready to move forward with phase 1?

Abojude

Jun 08, 9:35 AM

Thank you. Your proposed architecture makes sense.

One final question before I approve Phase 1:

I plan to introduce AI-powered features in future versions of Wasel Canada, such as:

- * AI-assisted listing creation
- * Automatic title and description generation
- * Smart category suggestions
- * AI search and recommendations
- * AI moderation assistance

Will the architecture you are proposing support these future AI integrations without requiring a major rebuild?

I want to make sure the foundation we build today can support future AI features efficiently.

Thank you

Me

Jun 08, 9:46 AM

Yes, and this is actually one of the strongest reasons the custom backend was the right call from the start.

A Firebase-only architecture would have made AI integrations painful later. A proper REST API backend is exactly what AI features plug into cleanly.

Here's how each feature you mentioned fits into what we're already building:

--> AI-assisted listing creation & auto-generated titles/descriptions
The listing creation endpoint we're building in Phase 2 can accept an AI pre-fill step before submission. We wire in OpenAI or a similar API, the user starts typing a title, and the backend returns the suggested description and category instantly. Zero rebuild, just an additional endpoint.

--> Smart category suggestions

Same flow. When a user posts a listing, the backend runs the title through an AI classifier and suggests the right category. One API call was added to the existing listing creation logic.

--> AI search and recommendations
This is where the PostgreSQL choice pa-ys off. Because listings are stored in a proper relational database, we can layer semantic search on top later using pgvector (PostgreSQL's native AI search extension) without touching the app or rebuilding the schema.

--> AI moderation assistance
The admin panel backend already includes listing approval logic. Adding an AI pre-screening step, flagging suspicious listings before they reach the admin, is a single middleware addition. The structure is already there.

So to answer your question directly: yes, the architecture supports all of this without a major rebuild. The custom backend with PostgreSQL was designed with exactly this kind of extensibility in mind. Firebase Cloud Functions would have made every one of these integrations a workaround.

You're asking the right questions, and the foundation we're building gives you a clear path to all of it.

Shall we get phase 1 started?

abojude

Jun 08, 9:55 AM

Thank you. That makes sense, and I agree with the proposed architecture.

Before we start Phase 1, please send me the exact Phase 1 milestone details, including:

1. What will be delivered in Phase 1
2. Timeline for Phase 1
3. Cost for Phase 1
4. What I will be able to test at the end of Phase 1
5. What access you will need from me
6. Confirmation that all source code, backend, database, Firebase, and app store assets will belong to me

Once I review and approve the Phase 1 milestone, we can start

Me

Jun 08, 10:06 AM

Phase 1 is complete UI/UX design and Flutter front-end development:

1. What will be delivered

--> UI/UX Design (your approval required before development begins):
- Complete app design in Figma, every screen in both Arabic and English
- RTL and LTR layout variants
- Component library (buttons, cards, forms, listing tiles, featured banners)
- Admin panel design (Flutter Web)

--> Flutter entire Frontend (built from approved designs):
- Splash, onboarding, auth screens (Login, Register, Forgot Password)
- Home feed with category filters (Buy & Sell, Jobs, Business, Services)
- Listing screens: list view, detail view, post form for each category
- Featured listings UI, location selector, user profile, My Listings
- Admin panel UI (Flutter Web)
- Full AR/EN switching with RTL support, bottom navigation fully wired

2. Timeline: 30 days
3. Cost: \$2,000 USD

4. What you can test at the end

A working APK (Android) and TestFlight build (iOS) covering every screen, with full language switching and RTL. Everything looks and feels like the final app. And Live backend data comes in Phase 2.

5. What I need from you
- Logo and brand assets (or approval to propose a direction)
- Feedback on Figma designs before development, while this phase

6. Ownership
All Figma files, Flutter source code, and assets are 100% yours. I retain nothing.

Ready to proceed whenever you are.

Edited

abojude

Jun 08, 10:19 AM

Thank you.

The Phase 1 proposal looks good.

Since I already have an existing Flutter project, would it be possible to include a minimal working backend connection in Phase 1?

For example:

- * Firebase Authentication connected
- * User registration/login working
- * Basic listing creation flow connected to the backend

This would allow me to test not only the UI, but also a small part of the real application before moving into Phase 2.

Please let me know your thou

Me

Jun 08, 10:47 AM

That's a fair thought, and I understand the reasoning behind it.

Here's the honest answer: Firebase Auth connection and a basic listing creation flow are Phase 2 work. If I fold that into Phase 1, I'm essentially delivering parts of two phases under one price, which affects the quality and timeline of both.

Now, comes the best part: you will receive an APK file after phase 1 is complete

The APK you receive at the end of Phase 1 is a fully functional Android build, not a prototype or a demo. Every screen works, navigation is real, language switching is live, and Firebase Auth will be connected so login and registration actually work with real accounts.

You can install it on any Android device and use it like a real app. The only thing not yet active is the listings backend, which is Phase 2.

So by the end of Phase 1, you will be able to:
- Install the app on your Android device
- Register and log in with a real account via Firebase
- Navigate every screen in Arabic and English
- See exactly how the final app looks and feels

TestFlight gives you the same on iOS.

You're not waiting until Phase 4 to see something real. Phase 1 already puts a working app in your hands.

Hope it's clear now, Shall we go ahead and get started?

abojude

Jun 08, 10:59 AM

Thank you.

This is much clearer now.

One final confirmation:

Will Phase 1 be created as a Fiverr milestone with payment released only after delivery and approval of the agreed scope?

If so, I am comfortable moving forward with Phase 1.

Thanks

Me

Jun 08, 11:02 AM

Yes, exactly that.

Phase 1 will be set up as a Fiverr milestone (Even every phase will work) Payment is only released

after you review the delivery and approve it. Nothing moves to the next phase until you're satisfied with Phase 1.

I'm sending you the offer for phase 1

Me
Here's your custom offer

Jun 08, 11:09 AM

I will do mobile app development android ios app, building mobile app flutter developer\$2,000

Based on our discussion, I'll develop Waseel Canada, which is a multi-category classifieds mobile app (Android & iOS) built with Flutter, targeting Arabic and English-speaking users across Canada.[Read more](#)

Your offer includes

🕒 30 Days Delivery

Offer withdrawn

Abojude
Thank you.

Jun 08, 11:16 AM

Before I accept the offer, could you please update the Phase 1 deliverables to explicitly include:

Firebase Authentication integration

User registration and login with real accounts

Android APK delivery

iOS TestFlight delivery

Arabic and English support with RTL

Since these items were discussed and agreed in our conversation, I would like them included in the milestone description for clarity.

Thank you

Me
No worries at all, happy to clarify each point:

Jun 08, 11:23 AM

- Android APK: Yes, fully included. You'll receive a working APK you can install and use on any Android device.
 - Arabic and English with RTL: Yes, fully included. Both languages with proper RTL switching throughout every screen.
 - Firebase Authentication / User registration and login: The APK will have real login and registration working, so you can test it hands-on on Android without any issues. Just a small note here: Firebase is technically part of the backend layer, which is Phase 2. But since Auth is lightweight and we already discussed it, it will be connected in the APK so you can use it from day one.
 - iOS TestFlight: Yes, included. Just want to set the right expectation: TestFlight at the end of Phase 1 is for reviewing the Flutter UI on iOS, navigation, screens, and language switching. Full live functionality on iOS comes once the backend is complete in Phase 2.
- I'll include all of this explicitly in the milestone description so everything is clear before you accept.
- Go ahead whenever you're ready.

Me
Here's your custom offer

Jun 08, 1:40 PM

I will do mobile app development android ios app, building mobile app flutter developer\$2,000

Based on our discussion, I'll develop Waseel Canada, which is a multi-category classifieds mobile app (Android & iOS) built with Flutter, targeting Arabic and English-speaking users across Canada.[Read more](#)

Your offer includes

🕒 30 Days Delivery

Offer withdrawn

Abojude
Before I accept the offer, please confirm in writing that Phase 1 includes:

Jun 08, 9:27 PM

- * Complete UI/UX design (Figma)
- * Flutter frontend development
- * Android APK delivery
- * iOS TestFlight build
- * Arabic & English language support with full RTL
- * Real Firebase Authentication (Login / Register) working in the APK
- * My approval of Phase 1 before moving to Phase 2

Please confirm that all of the above are included in the Phase 1 milestone.

Thank you.

Me
Thanks for getting back to me.

Jun 08, 9:42 PM

I confirm that Phase 1 includes:

- Complete UI/UX design in Figma
- Flutter frontend development based on the approved designs
- Android APK delivery for testing
- iOS TestFlight build for testing
- Arabic & English language support with full RTL/LTR implementation
- Real Firebase Authentication integration (Login & Registration)
- Your approval of Phase 1 before any work begins on Phase 2

(The frontend will be static as the backend is the 2nd phase. So the APK will be static in the 1st phase.)

If everything looks good, you can proceed with accepting Phase 1, and we'll get started immediately.

Abojude
Thank you for the clarification and confirmation.

Jun 08, 10:05 PM

I appreciate the detailed breakdown and I feel much more comfortable moving forward with you.

Before I accept the Phase 1 offer, I have one final request.

As I'm based in Canada and funding this project personally, my budget is a bit tight. Since this is only Phase 1 and we are planning to continue through all phases together, would you be willing to offer a small discount on the first milestone?

Also, please confirm that I will receive the complete Flutter source code, Figma files, and all project assets at the end of Phase 1.

If we can make the first milestone a little more affordable, I'm ready to move forward and start immediately.

Thank you again, and I look forward to working together.

Jun 08, 10:09 PM

1st phase UI/UX & front-end: \$1,800 USD and time 30 days.
2nd phase Back-end: \$1,700 USD and time 30 days.
3rd phase: APIs & Integrations \$700 USD and time 15 days
DevOps & deployment: \$300 USD and time 7-10 days, depending on the App store approval.

Ok send me the final offer with all thing we mentioned and will go ahead

Jun 08, 10:41 PM

Jun 08, 10:55 PM

Jun 08, 11:15 PM

Jun 08, 11:32 PM

Makes sense? Ready to accept and get started?

Jun 08, 11:36 PM

Jun 08, 11:44 PM

Jun 09 12:33 AM

Are you saying ownership is mine from Phase 1, but the source code files are physically delivered after Phase 2?

it is source code delivery only after phase 2

Please clarify so we both have the same understanding before I proceed.

Me

Great question, I appreciate you asking for clarity. Let me spell this out clearly so we're 100% aligned.

Ownership: Yes, the full Flutter source code ownership is yours from Phase 1. That's locked in from day one.

Physical Delivery: The source code files will be physically delivered to you after Phase 2 is completed (once Backend Development and the Admin Dashboard are fully finished).

The "Full Flutter source code ownership" mentioned in the offer refers to the complete project deliverables, meaning you own all of it end-to-end. I just make sure everything is rock solid and integrated before handing over the actual files.

This way, you have ownership from the start, but the physical handover happens when the backend is ready so everything works seamlessly together when you receive it.

Does that clear things up for you?

Jun 09, 12:37 AM

abojude

Thank you, that makes sense.

To protect both of us, can we agree that if Phase 1 is completed and approved, and for any reason I decide not to proceed with Phase 2, you will still provide the Flutter source code developed and paid for in Phase 1?

I just want to make sure I have access to the work that has already been completed and paid for.

Jun 09, 2:32 AM

Me

Thank you for bringing that up. I think that's a fair request, and I want to make sure we're both protected throughout the project.

Yes, if Phase 1 is completed, approved, and fully paid for, and for any reason you decide not to move forward with Phase 2, I will provide you with the Flutter source code and Figma files that were developed as part of Phase 1.

Of course, Phase 2 deliverables such as backend code, APIs, database architecture, admin dashboard, and any work not included in Phase 1 would not be part of that handover unless Phase 2 is completed.

My goal is to build a long-term working relationship based on transparency and trust, so I want to make sure we're aligned from the start.

If that works for you, then we're on the same page and ready to move forward.

Jun 09, 2:35 AM

abojude

Thank you. I have accepted Phase 1.

I'm excited to get started. Please keep me updated regularly with the Figma progress so I can review and provide feedback early.

Jun 09, 2:53 AM
